

Executive Summary

The store is **back online**. The July 9 outage was a free-tier Supabase auto-pause; the backend has been restored and a **daily keep-alive was added** so it will not silently pause again.

The site is a **strong, real foundation** — Supabase auth, a server-gated admin portal, real user/staff management, a mobile-first “Custom Inventory” flow with camera photo upload, and real order persistence. It is **not yet a store that can transact or be run day-to-day**: payment is mocked and tax is zero, and the admin is half-connected (the Dashboard and Orders screens are still mock data). SEO, security headers, and legal pages are thin.

Beyond the screen-by-screen audit, this report adds two lenses: a walkthrough of the **common user journeys** (search, purchase, admin add-with-photo) and a measured **visual & control-usability** pass. Two themes emerge there: **product images are broken/irrelevant** (the biggest visual problem), and **most controls are small** (37 of 50 under the 44px tap-target guideline) with the red accent sitting near the minimum contrast threshold.

Bottom line: the emergency is over and guarded against. The priorities are: make the admin honest (real Dashboard/Orders), turn on payments + tax, fix product images, and run a focused visual/tap-target polish pass.

Area	Status	Notes
Frontend / deploy	HEALTHY	Current with the repo; renders correctly
Backend (Supabase)	RESTORED	Back online; daily keep-alive added
Commerce (pay / tax)	MOCK	Payment simulated; tax = 0 — cannot transact
Admin data	PARTIAL	Dashboard + Orders mock; others real
Visual / usability	NEEDS WORK	Broken images; small tap targets; low-contrast accents
SEO / security headers	THIN	Missing metadata, sitemap, CSP
Mobile	CORE FIXED	Shop + admin layouts fixed; polish remains

Admin Portal — Functional + UX

Screen-by-screen from a signed-in walkthrough of the live portal:

Screen	State	What's there
Dashboard	MOCK	Metrics + Recent Activity hardcoded
Inventory	REAL*	433 items, flag toggles + edit; no add/delete/search/pagination
Custom Inventory	REAL*	CRUD + search + photo capture; but lists accessories, not cards
Orders	MOCK	Fake rows; Search/Export/Fulfill/View all dead
Customers	REAL	Real profiles + order totals + tier
Users	REAL	Real CRUD, roles, reset/delete (service key wired)

Admin UX: the shell is consistent and on-brand, and destructive actions are guarded (self-delete disabled, delete confirmation). But the most-used screen (Inventory) lacks the search & pagination that Custom Inventory has; the dead controls on Dashboard/Orders look real but do nothing, which erodes trust; existing Custom Inventory rows show blank thumbnails; and there are no breadcrumbs on the add/edit sub-pages. **REAL but incomplete.*

Common Flows — UX Walkthrough (live)

Search & discovery

Works:

- Typing a query filters instantly; category / subcategory / sort / availability filters all present.

Gaps:

- No result count and no clear (x) button; the empty state is a bare “No products found” with **no “Clear filters”** action (a dead-end).
- Product images are generic/irrelevant and often **fail to load** (blank cards).
- Two links dead-end to “no results”: hero “Browse TCG” and footer “TCG Cards” (point at a non-existent ?subCategory=Pokémon).

Purchase

Works:

- Add-to-Cart gives an instant toast + slide-in cart, a free-shipping progress bar (“Only \$265 away...”), a quantity stepper, remove, and the 3-item limit — clear, well-designed feedback.

Gaps:

- The **cart empties on page reload** (in-memory only) — a shopper who refreshes loses everything.
- Payment is **mock** and there is **no tax line**; cart thumbnails are blank.
- (A real order was not submitted during the audit to avoid writing to the live database.)

Admin — add an item with pictures

Works:

- The Add-a-Single form is the best-designed screen: photo capture (“Add Photos” / “Take Photo”) front and center, mobile-first, sensible field grouping. The upload pipeline was verified end-to-end earlier (admin upload → public read → delete, all succeeded) and a local create persisted and appeared on the storefront.

Gaps:

- A live production upload was intentionally **not performed** (would create real store data).
- Existing rows show **blank thumbnails**; the “Make primary” photo action is hover-only (no touch equivalent).

Visual & Control Usability (measured live)

Measured from the live storefront’s computed styles (page background is near-black). WCAG AA requires 4.5:1 for normal text, 3:1 for large/bold text and UI.

Element	Size	Contrast	Verdict
Body / nav / headings	14–24px	7.8–16.8 : 1	PASS
Red price on near-black	20px bold	3.85 : 1	LARGE-TEXT ONLY
Primary button (white on red)	13px	4.37 : 1	MARGINAL (< 4.5)
Muted secondary / placeholder	9–14px	low	VERIFY

Tap targets: 37 of 50 visible controls are under 44px tall (median 25px, smallest 18px). The big CTAs (Add to Cart, Sign In) are fine, but filter buttons, category links, sort/search, and icon buttons are cramped for touch. Icon-only buttons (cart, heart, admin edit/reset/delete ≈34px) are also unlabeled.

Visual clarity: the dominant problem is **broken/empty product images** — cards render as half-empty black rectangles, so products are hard to tell apart and the store reads as unfinished. Badges are small (~12px) but legible; the overall visual system (dark theme, uniform red buttons, clear type hierarchy) is consistent and clean.

Priority visual fixes: (1) fix product images; (2) enlarge tap targets to ~44px and label/enlarge icon buttons; (3) darken the red or enlarge/bolden button + price text to clear 4.5:1; (4) replace hover-only actions and run a Lighthouse contrast + focus-state pass.

Note: below-the-fold DOM sampling was partly flaky; the figures above are the ones that resolved cleanly plus the robust control-height distribution — not a full per-element table.

What Needs To Be Done — Detailed Steps

Priority-ordered. Each notes who does it and links official docs where useful.

1. Keep the store up (mostly done) [DONE]

- **Done:** a daily keep-alive (`.github/workflows/supabase-keepalive.yml`) pings Supabase so the free tier can't idle into a pause.
- **Still recommended:** an uptime monitor (proactive alert) and, for launch, Supabase Pro (no auto-pause).
- **Developer:** make the product loader fall back to bundled data / an explicit error instead of an empty catalog.

Docs & support: [Supabase pricing](#) · [Better Stack uptime](#)

2. Make the admin honest (real data) [HIGH]

- Wire the **Dashboard** metrics + Recent Activity to real queries.
- Replace the mock **Orders** table with real orders and wire Fulfill (status transitions) + Search/Export.
- Replace the hardcoded **account order history** so customers see their real orders.
- Core data-integrity fix: a real order is saved today but invisible to both customer and owner.

3. Fix product images [HIGH]

- Replace the failing/irrelevant loremflickr placeholders with real product photos (or a reliable host + graceful fallback).
- This is the single biggest visual/credibility issue and affects every storefront screen.

4. Turn on real payments + tax [HIGH]

- Integrate Clover's hosted card iframe (tokenize → charge → webhook), idempotency, and a /checkout/canceled route; card data never touches your server.
- Add server-side tax + a tax line; advance order status on successful payment.

Docs & support: [Clover developer docs](#)

5. Add transactional email [HIGH]

- Connect Resend or Postmark as Supabase custom SMTP for signup verification + order confirmations (also removes the free email's rate limits).

Docs & support: [Resend](#) · [Supabase SMTP](#)

6. Visual & control usability pass [MEDIUM]

- Enlarge tap targets to ~44px; label or enlarge icon buttons; replace hover-only actions.
- Darken the accent red / enlarge button + price text to clear WCAG 4.5:1; Lighthouse contrast + focus-state pass.
- Cart persistence across reloads; search result count + clear button; a "Clear filters" empty state.
- Bring Inventory to parity with Custom Inventory (search, pagination, add/delete); add thumbnail placeholders.

7. SEO + security headers + link fixes [MEDIUM]

- generateMetadata on PDPs, app/sitemap.ts, app/robots.ts, JSON-LD, canonicals, metadataBase.
- CSP + X-Frame-Options + Referrer-Policy + Permissions-Policy via next.config.ts (HSTS + nosniff already present).
- Fix the two dead ?subCategory=Pokémon links (hero + footer) → ?subCategory=TCG.

Docs & support: [generateMetadata](#) · [sitemap.ts](#) · [next.config.headers](#)

8. Content, legal & singles cleanup [MEDIUM]

- Publish Privacy, Terms, Returns, Shipping, FAQ, Contact (payment processors require T&Cs + privacy); wire real footer links; real store address/hours/map.
- Resolve the “single = not sealed” definition so Custom Inventory stops listing accessories as cards.

Suggestions & Support

Uptime monitoring

The keep-alive prevents pausing but can't wake an already-paused project or catch other outages — add a free monitor with alerts.

[Better Stack](#) · [UptimeRobot](#)

Rotate the credentials from setup

Rotate the Supabase secret key and admin password (handled through tooling during setup); re-set the secret in Netlify + .env.local afterward.

[Supabase API keys](#)

CI + tests

GitHub Actions (lint + type-check), Netlify deploy previews, and Vitest/Playwright on the critical paths — catches regressions like the empty-catalog behavior before production.

[GitHub Actions](#) · [Playwright](#)

Error tracking

Add Sentry so production server/render errors are captured with context (silent today).

[Sentry for Next.js](#)

Accessibility pass

Run Lighthouse + keyboard testing: contrast, visible focus states, dialog semantics on the cart drawer, and labels on all icon buttons.
