

TopRatedCC — Full Site Audit

Checklist format — check each box off as an item is fixed

Compiled 2026-08-22 · Covers storefront, admin portal, technical/SEO/security/accessibility, and a live-site verification pass against <https://topratedcc.netlify.app>

How to use this: print it and check boxes by hand, or open in Preview/Acrobat and use the markup tool to stamp a checkmark in each box. Items are ordered roughly by priority within each section.

Progress: 13 of 28 items fixed as of 2026-08-22.

0. Highest Priority — Pricing Integrity

Now that real payments are live, this carries legal/compliance weight, not just UX.

- ☒ **Sale badges show a fabricated "original price" — FIXED**
app/shop/[id]/page.tsx (~line 82–86): the struck-through "was" price is computed as current price × 1.2 at render time — it is not a real prior price from any data source. Every "Sale" item implies a discount that never existed. Several U.S. states regulate fake reference pricing — recommend fixing before it's noticed by a customer or regulator.

1. Hurts Real Purchases

These affect the checkout/purchase path directly, now that Clover payments are live.

- ☒ **Guest checkout is unreachable — FIXED**
components/CartDrawer.tsx routes anyone not logged in to /login before checkout, even though the backend fully supports guest orders (placeOrder accepts a null customer_id, and the confirmation screen has a "Guest" name fallback). Confirm whether requiring an account is an intentional business decision.
Resolved: CartDrawer now goes straight to checkout for everyone; a guest sees a sign-in/create-account nudge instead of a forced redirect.
- ☒ **/cart is a dead 404 — FIXED**
There is no standalone cart page/route — only a slide-out drawer. Bookmarking, refreshing on, or navigating back to /cart lands a customer on the site's 404 page.
- ☐ **No error boundaries anywhere in the app**
Zero error.tsx files exist except the root not-found.tsx, and zero loading.tsx files exist at all. If Supabase hiccups mid-checkout or on any admin page, the visitor sees Next.js's raw default error screen instead of a graceful message.
- ☒ **Admin Orders can never change status — FIXED**
Nothing in the codebase ever updates orders.status after checkout — every order is permanently stuck at "Processing," even though the UI defines badges for Shipped/Delivered/Canceled/Refunded. Staff have no way to run fulfillment from this screen.

2. Visibly Broken / Dead Ends

- ☒ **Footer "Sealed Products" and "Premium Singles" links are dead — FIXED**
 Both link to `?category=sealed` / `?category=singles`, which are not real category values — confirmed live: both return "No products match these filters." (The homepage hero already got this exact fix months ago; the footer was missed.)
- ☒ **Footer "Merchandise" link is dead — FIXED**
 Links to `?subCategory=Store Merch`, which matches zero products — confirmed live. *Resolved: no real "merchandise" category exists in the taxonomy at all, so this now points at Accessories (closest real match) instead.*
- ☒ **Footer "TCG Cards" → Pokémon link — needs a manual check — FIXED**
 Static code analysis says this filter value is invalid, but a direct live HTTP test returned real results for the same query. The two checks disagree — click it yourself to confirm the real behavior before treating it as broken or fine. *Resolved: confirmed broken live; now points at ?subCategory=TCG (all TCG) instead of the invalid Pokémon category value.*
- ☒ **"Get Directions" doesn't point at the store — FIXED**
`app/page.tsx` links to the bare `maps.google.com` homepage instead of a maps query/pin for the actual store address. *Resolved: now links to a real Google Maps query for the real address.*
- ☒ **Want-list doesn't survive a page refresh — FIXED**
 Unlike the cart (already fixed to persist to `localStorage`), the favorites/want-list heart-toggle uses plain React state only. Customers lose their saved items on refresh or return visit. *Resolved: WantListContext now hydrates/persists to localStorage (tr_wantlist), mirroring the existing CartContext pattern. Also fixed a related bug found during testing — the heart-toggle button on product cards had no CSS at all (rendered as `class="undefined"`, invisible) and now has proper styling matching the site's badge/chip visual language.*
- ☒ **Editing/toggling a product in Admin Inventory blanks its Category — FIXED**
`lib/actions.ts` `updateProduct` returns an empty category on save, and the table blindly applies it to local state — the row's Category cell goes blank and can vanish from an active category filter until the page is reloaded. *Resolved: updateProduct in lib/actions.ts now derives the real top-level category from category_id via the categories table (same lookup pattern as rowToProduct in lib/db.ts) instead of hardcoding an empty string.*

3. Content Gaps — Trust & Compliance

- ☐ **No Privacy, Terms, Returns, Shipping, or FAQ pages exist**
 The footer links to all of these, but every one is a dead `href="#"` anchor — there is no real page or content behind any of them anywhere in the app.
- ☒ **Placeholder store address and phone number are still live — FIXED**
 "123 Collector's Avenue, Hobby City, CA 90210" and "(555) 123-4567" appear on the homepage and footer. Notably, the tax calculation already correctly references "Windsor, CA" — only the customer-facing display copy was never updated. *Resolved: real address/phone now shown on the homepage and footer, both linked (maps + tel:).*

☒ **Confirm support@topratedcards.com is a real, monitored inbox — FIXED**

This address didn't match the live site's actual domain (topratedcc.netlify.app), and turned out to not be a real monitored inbox at all. *Resolved: the footer link now opens an in-app /contact form instead of a mailto: link. Submissions create a message thread that logged-in customers can follow up on under Account → Messages, and staff read/reply from a new Admin → Messages inbox (with an open-count badge). No external mailbox required.*

☐ **Account → Settings shows raw internal dev notes to customers**

app/account/page.tsx literally displays: "Settings functionality will be implemented in Phase 4 (Supabase Integration)."

☐ **Admin "Customers" count includes staff/admin accounts**

Both the Dashboard stat and the Customer Directory query every profiles row with no role filter, inflating the real customer count with your own staff logins.

☐ **Homepage "Coming Next Month" event never resolves**

Static copy with no real date attached — it will read as perpetually "next month" no matter when a visitor loads the page.

4. SEO

More impactful now that the site is a real revenue channel.

☐ **No robots.txt or sitemap.xml**

Both confirmed 404 live — search engines have no sitemap to discover your ~400 product pages and no crawl directives at all.

☐ **Every page shares one identical, generic title and meta description**

Confirmed live: product detail pages, the homepage, and everything else all render the same generic title/snippet. No generateMetadata exists anywhere except the root layout.

☐ **No Open Graph/Twitter tags, canonical URLs, or product structured data**

Sharing a product link shows no image/preview anywhere, and there's no JSON-LD for rich search results (price, availability, ratings).

5. Security Headers

☐ **No CSP, X-Frame-Options, Referrer-Policy, or Permissions-Policy**

HSTS and X-Content-Type-Options (nosniff) are present, but nothing else is configured anywhere in next.config.ts or a middleware.ts (which doesn't exist). No known live vulnerability found, but this is standard hardening a production payment site should have.

6. Accessibility

- ☐ **Several icon-only buttons have no accessible label**
Nav search/cart/menu buttons, the cart drawer's close/quantity/remove buttons, and the toast dismiss button all lack aria-label or visible text — a screen reader just announces "button." (Other buttons elsewhere in the same files do this correctly, so it's inconsistent, not a blanket gap.)
- ☐ **Muted gray text fails contrast standards in several places**
--text-muted (#6b7280) measures 3.8–4.1:1 against the dark backgrounds it's used on (shop, product pages, admin) — below the 4.5:1 WCAG AA minimum for normal text.
- ☐ **Admin's product-edit form has unlabeled inputs**
components/ProductEditModal.tsx uses bare <label> tags with no htmlFor/id association, unlike every other form in the app, which does this correctly.

7. Content Quality

- ☐ **Live product name typo: "1000 Peice Marvel Puzzle"**
Confirmed live in the database — "Peice" should be "Piece."
- ☐ **Most of the catalog still shows generic stock photos, not real product photos**
Roughly ~78% of products in the offline fallback dataset use loremflickr placeholder images (worth confirming the exact live count directly against Supabase) — including some \$400–600+ sealed boxes shown with a random generic photo instead of the actual item.

8. Minor / Cleanup

- ☒ **CartDrawer hardcodes its own \$300 free-shipping threshold — FIXED**
Duplicates a value that already exists as a shared constant in lib/pricing.ts (used correctly everywhere else). Works today only because the numbers happen to match — will silently drift if the real threshold ever changes.
- ☐ **No loading.tsx anywhere**
Every page fully blocks on data fetching with no streaming/skeleton fallback while it loads.
